# Outline of Lecture 02

- ◆ Fundamentals of image data representation
  - Standard image
- ◆ Gray-level image
  - Bitmap and bitplane (位平面)
- ◆ Color image
  - 24-bit color image and 8-bit color image
  - Histogram and color lookup tables
- ◆ Some popular image file format
- ◆ Some calculations
  - How to calculate the size of image?
  - How to transform 24 bit color image to 8 bit color image?
  - How to calculate histogram?
  - How does dithering work?

# Fundamentals of Image Data Representation

## Images

# Fundamentals of Image Data Representation

## ◆ Images consist of pixels

- Pixel: picture element
- The smallest discrete component of an image on the screen

## ◆ Image resolution

- The number of pixels in a digital image

## ◆ Standard images

- Illustrate algorithms and compare the performance
- Lena: for gray-level image generally
- Baboon(狒狒): for color image generally

# Standard Images

- Lena:
  - Image Resolution is  $256 * 256$
- Baboon:
  - Image Resolution is  $512 * 512$

# Fundamentals of Image Data Representation

R

G

B

# Fundamentals of Image Data Representation

- Matlab, `imread(filename)` 读取 uint8格式的图像(取值范围0 -255)
- See [demo1RGB](#)

# Outline of Lecture 02

- ◆ Fundamentals of image data representation
  - Standard image
- ◆ Gray-level image
  - Bitmap and bitplane
- ◆ Color image
  - 24-bit color image and 8-bit color image
  - Histogram and color lookup tables
- ◆ Some popular image file format
- ◆ Some calculations
  - How to calculate the size of image?
  - How to transform 24 bit color image to 8 bit color image?
  - How to calculate histogram?
  - How does dithering work?

# Gray-Level Image (灰度图像)

- ◆ Image is represented using luminance (亮度) information only
- ◆ 8-bit gray-level image
  - Each pixel has a gray value between 0 and 255
  - Matlab code : `rgb2gray(I)`

24-bit color Image

Gray Image

# Gray-Level Image (灰度图像)

- ◆ 512x512的24位彩色图像转成8位灰度图像后，未压缩时数据量关系？
  - a. 灰度图像和彩色图像大小一样
  - b. 灰度图像是彩色图像数据量大小的一半
  - c. 灰度图像是彩色图像数据量大小的三分之一

## Binary Image (二值图像)

- ◆ Each pixel is stored as a single bit 0/1.
- ◆ Also referred as 1-bit image
- ◆ Use for the pictures containing simple graphics or text

## Bitmap of Gray-level Image

- ◆ The two-dimensional array of pixel values that represent the images/graphics

bit\_map =

254	210	180	144
112	78	40	0

# Bitplane (位平面) of 8-bit image

## ◆ Bitplanes

- Consider the 8-bit image as a set of 1-bit bitplanes
- Each plane consists of a 1-bit representation of the image

# Bitplane (位平面) of 8-bit image

20	30	120
255	150	10
128	80	230

# Demo of gray image

## ◆ Demo2

- see [demo2rgb2gray](#)
- Show color image, gray image, bit image
- Convert color to gray and bit images

## ◆ Demo3

- See [demo3bitplane](#)
- Show bitplane

# Outline of Lecture 02

- ◆ Fundamentals of image data representation
  - Standard image
- ◆ Gray-level image
  - Bitmap and bitplane
- ◆ Color image
  - 24-bit color image and 8-bit color image
  - Histogram and color lookup tables
- ◆ Some popular image file format
- ◆ Some calculations
  - How to calculate the size of image?
  - How to transform 24 bit color image to 8 bit color image?
  - How to calculate histogram?
  - How does dithering work?

# 24-bit Color Image of RGB Model

- ◆ R
  - 8-bit
- ◆ G
  - 8-bit
- ◆ B
  - 8-bit

Blue Channel

Green Channel

## 24-bit Color Image(真彩色)

- ◆ Each pixel is represented by three Bytes, usually RGB
  - Supports  $256*256*256$ , totally 16.8-million possible combined color
  - Storage: for image resolution of  $640*480$ , needs 900KB ( $640*480*3/1024$ )
- ◆ Some 24-bit color images are stored as 32-bit image
  - Extra byte of data for special-effect information

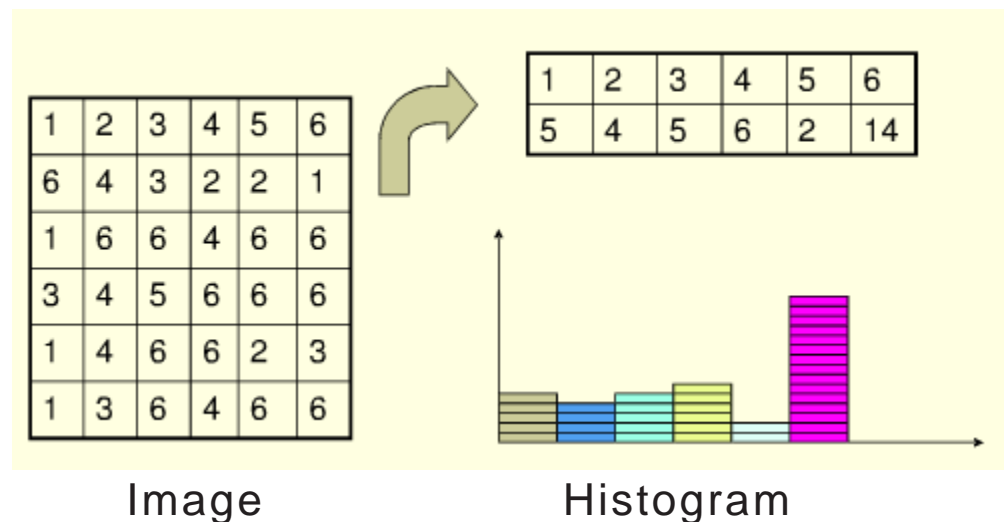

# Color Lookup Tables (颜色查找表)

- ◆ Many systems can make use of 8 bits of color in producing a screen image (伪彩色).
- ◆ Such image files use the concept of a **lookup table** (查找表) to store color information.
- ◆ Use index (索引) or code value (编码值) instead of 24-bit color information for each pixel
- ◆ Color lookup the table works well for small combinations

# Image Histogram (直方图)

- ◆ A histogram is an accurate representation of the distribution of numerical data
- ◆ See [demo4Hist](#)

Probability 
$$p_r(r_k) = \frac{n_k}{n}$$

$n_k$  is the number of pixels that have a value  $r_k$   
 $n$  is the total number of pixels of the image

# 8-bit Color Image

- ◆ Divide the RGB cube into equal slides in each dimension
  - R: 3-bit; G: 3-bit; B: 2-bit;
  - Edge artifacts (边缘伪影)
  - See [demo5RGBto8](#)
- ◆ Based image histogram, select 256 most popular colors

24-bit颜色图

8-bit颜色图

# Outline of Lecture 02

- ◆ Fundamentals of image data representation
  - Standard image
- ◆ Gray-level image
  - Bitmap and bitplane
- ◆ Color image
  - 24-bit color image and 8-bit color image
  - Histogram and color lookup tables
- ◆ Some popular image file format
- ◆ Some calculations
  - How to calculate the size of image?
  - How to transform 24 bit color image to 8 bit color image?
  - How to calculate histogram?
  - How does dithering work?

# Some Popular Image File Formats

## ◆ BMP

- BitMap
- Mainly use RGB color model

## ◆ Gif

- Graphics Interchange Format
- Important formats because of its historical connection to the WWW and HTML

## ◆ PDF

- Portable Document Format
- Include compression

## ◆ JPEG

- Joint Photographic Experts Group
- Currently the most important common file format

# Outline of Lecture 02

- ◆ Fundamentals of image data representation
  - Standard image
- ◆ Gray-level image
  - Bitmap and bitplane
- ◆ Color image
  - 24-bit color image and 8-bit color image
  - Histogram and color lookup tables
- ◆ Some popular image file format
- ◆ Some calculations
  - How to calculate the size of image?
  - How to transform 24 bit color image to 8 bit color image?
  - How to calculate histogram?
  - How does dithering work?

# How to Calculate the Size of Image

## ◆ 8 bit Gray image

- Image resolution:  $640 \times 480$

## ◆ Bytes

- $640 \times 480 \times 8 = 2457600\text{b} = 2457600 / 1024 \text{ Kb} = 2400\text{Kb}$
- $640 \times 480 = 307200\text{B} = 307200 / 1024 \text{ KB} = 300\text{KB}$

## ◆ 24 bit color image

## ◆ Bytes

- $640 \times 480 \times 24 = 7372800\text{b} = 7372800 / 1024 \text{ Kb} = 7200\text{Kb}$
- $640 \times 480 \times 3 = 921600\text{B} = 921600 / 1024 \text{ KB} = 900\text{KB}$

# How to Transform 24-bit to 8-bit?

- ◆ Divide the RGB cube into equal slides in each dimension
  - R: 3-bit (0-7); G: 3-bit (0-7); B: 2-bit (0-3);
  - See [demo5RGBto8](#)

24-bit颜色图

8-bit颜色图

# How to Calculate Histogram?

## ◆ Histogram

- representation of the distribution of numerical data

## ◆ Help hist, imhist in Matlab

- `N = hist(Y)` bins the elements of `Y` into 10 equally spaced containers and returns the number of elements in each container. **`Y` is a vector.**
- `imhist` displays a histogram for the **intensity image**

## ◆ See [demo4Hist](#)

# How Does Dithering (抖动) Work?

- ◆ 用只有黑墨的打印机，怎么打印出一个灰度图像？
- ◆ Basic strategy of dithering work
  - Trade intensity resolution for spatial resolution
- ◆ Dithering
  - To calculate patterns (图案) of dots such that values from 0 to 255 correspond to patterns that are more and more filled at darker pixel values, for printing on a 1-bit printer

# Dithering Example

## ◆ Halftone printing (网板打印)

- Replace a pixel value by a larger pattern, say  $2 \times 2$  or  $4 \times 4$
- Rule: If the intensity is  $>$  the dither matrix entry then print an on dot at that entry location: replace each pixel by an  $n \times n$  matrix of dots

## ◆ Dithering matrix

$$\begin{bmatrix} 0 & 2 \\ 3 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 8 & 2 & 10 \\ 12 & 4 & 14 & 6 \\ 3 & 11 & 1 & 9 \\ 15 & 7 & 13 & 5 \end{bmatrix}$$

In the printing color space, 0 represents white, 255 represents black. We can first re-map image values in 0...255 into the new range 0..4 by (integer) dividing by 256/5. Then, e.g., if the pixel value is 0 we print nothing, in a  $2 \times 2$  area of printer output. But if the pixel value is 4 we print all four dots.

# Dithering Example

$$\begin{bmatrix} 0 & 2 \\ 3 & 1 \end{bmatrix}$$

0	1	2
3	4	0
1	2	3
4	0	1

0	0	1	0	1	0
0	0	0	0	0	1
1	1	1	1	0	0
0	1	1	1	0	0
1	0	1	0	1	1
0	0	0	1	0	1
1	1	0	0	1	0
1	1	0	0	0	0

# Dithering Example

$$\begin{bmatrix} 0 & 2 \\ 3 & 1 \end{bmatrix}$$

0	1	2
3	4	0
1	2	3
4	0	1

0	0	1	0	1	0
0	0	0	0	0	1
1	1	1	1	0	0
0	1	1	1	0	0
1	0	1	0	1	1
0	0	0	1	0	1
1	1	0	0	1	0
1	1	0	0	0	0

- Note that for a dithered image, since replacing each pixel by a  $4 \times 4$  array of dots, makes an image 16 times as large.

# Dithering Example

## ◆ Ordered dither (有序抖动)

- turning on the printer output bit for a pixel if the intensity level is greater than the particular matrix element just at that pixel position

$$\begin{bmatrix} 0 & 8 & 2 & 10 \\ 12 & 4 & 14 & 6 \\ 3 & 11 & 1 & 9 \\ 15 & 7 & 13 & 5 \end{bmatrix}$$

0	1	2	3	4	5	6	7
6	7	8	9	10	11	9	10
12	13	14	15	16	0	1	2
1	2	3	4	5	6	3	4
7	8	9	10	11	12	7	8
13	14	15	16	0	1	10	11
2	3	4	5	6	7	2	12
8	9	10	11	12	13	14	15

0	0	0	0	1	0	0	0
0	1	0	1	0	1	0	1
1	1	1	1	1	0	0	0
0	0	0	0	0	0	0	0
1	0	1	0	1	1	1	0
1	1	1	1	0	0	0	1
0	0	1	0	1	0	1	1
0	1	0	1	0	1	1	1

# Algorithm

- An algorithm for ordered dither, with  $n \times n$  dither matrix, is as follows:
- See [demo6dither](#)

BEGIN

```
    for  $x = 0$  to  $x_{max}$            // columns
        for  $y = 0$  to  $y_{max}$        // rows
             $i = x \bmod n$ 
             $j = y \bmod n$ 
            //  $I(x, y)$  is the input,  $O(x, y)$  is the
            output,
            //  $D$  is the dither
            matrix. if  $I(x, y) > D(i, j)$ 
                 $O(x, y) = 1$ ;
            else
                 $O(x, y) = 0$ ;
```

END

## Results
